Allowable Subject Matter

1. Claims 1-15 are allowed.
2. The following is a statement of reasons for the indication of allowable subject matter:

The present invention relates to method for processing signal in communication system having plurality antennas. Conventionally, in such system, an autocovariance matrix of signals sampled from the signals before being despread is calculated, an autocovariance matrix of signals sampled from the signals after being despread is calculated, and the weight vector for the spatial processing is calculated from the matrices. Prior art of record, taking individually or collectively, fails to fairly teach an improved method for processing signal in a communication system having a plurality of antennas including the claimed subject matter "(a) extracting a first signal mostly including a specific signal, and a second signal mostly including a signal other than the specific signal, from a signal received at the plurality of antennas; (b) calculating an autocovariance matrix of each of the first and second signals; (c) dividing at least any one of the calculated autocovariance matrices into a diagonal component and a non-diagonal component, to separate the matrix into matrices of the components" in independent claim 1 (claims 2-15 depend therefrom). Thus, claims 1-15 are found to be novel and unobvious over prior art of record.
